

It is Time to Pull the Plug on the “Experiment” of Universal Hepatitis B Vaccination in the United States.

This essay is being written because of concerns about the welfare of our children. We feel that they are being given at birth, a potentially dangerous vaccine which many may not need.

Dr. Waisbren’s interest in the occurrence of autoimmune disease after viral vaccination began in 1980 when he observed six patients who developed multiple sclerosis (MS) after being given the swine flu vaccination in 1976.¹ He then observed this to happen in five patients who were given hepatitis B vaccinations.² It took years before he could get this observation published. By that time it was confirmed by a Belgium investigator, Herroelen.³ Since then, by even a cursory review of the published literature, we have found 198 articles, by 733 authors, in 111 peer reviewed journals from 21 different countries that reported adverse event that followed hepatitis B vaccination. The majority of these articles report the occurrence of autoimmune reactions.

In spite of this wealth of clinical observations, the last summary article about hepatitis B vaccine which came from the CDC, failed to mention the potential toxicity of this vaccine.⁴ Furthermore, the CDC and the FDA still deny that autoimmunity occurs after hepatitis B vaccine on the basis of two articles in “peer reviewed” journals that can be considered to be underpowered statistically and possibly influenced by conflicts of interest of the authors.⁵⁻⁶ These articles are discussed in the “commentary” available on this website.

In 2004, Hernan, using statistics that were based on adequate databases, showed convincingly that a person receiving the hepatitis B vaccination had a three-fold increase in the chance of getting MS.⁷ In spite of this convincing study, the government has not backed away from its support of universal hepatitis B vaccination. In addition, articles have appeared from university centers that denigrate Hernan’s article.⁸

In 1996, Dr. Waisbren wrote the article, “*Universal hepatitis B Vaccination: Is it a Sword of Damocles Hanging Over the Head of the American People?*”, also available on this website. Through a series of coincidences and an awakening of national concern about hepatitis B vaccine, this essay came to the attention of John Mica, a Congressman from Florida. He invited Dr. Waisbren to appear before a committee of Congress to present his concerns.
